

INBOUND CREW — Team & Organizational Structure

Cross-Functional Startup Architecture · Sales Strategy · Engineering Engine · FirstWave

1. Executive Summary: Breaking Down Startup Silos

The Inbound Crew's organizational structure is explicitly designed to eliminate the separated, disconnected departments that routinely slow down early-stage technology startups. Instead of maintaining rigid boundaries between business development and technical engineering, our team operates in continuous cross-functional synchronization. Every team member understands both the codebase and the unit economics of the automotive repair shops we serve.

This structural blueprint details our division of labor, customer acquisition methodology, core technological ownership, and business strategy prepared for the **FirstWave Competition**.

2. Customer Acquisition Strategy: Grassroots Collaboration

Customer acquisition is not relegated to a detached sales silo—it is a shared team discipline. Every member of the Inbound Crew maintains active, authentic connections within local automotive, technical, and commercial business communities.

- **Bypassing Cold Outreach:** Rather than burning capital on cold calling or digital ads that fail with local trades, we leverage personal introductions to get past the front office directly to shop owners.
- **Live Shop-Floor Validation:** We test and demonstrate our camera system directly on active shop floors. Experiencing real-world mechanic workflows firsthand ensures our software solves genuine garage bottlenecks.

3. Business, Vision & Revenue Strategy

Our sales engine follows a low-friction '**Land-and-Expand**' trajectory designed for rapid adoption by independent garages:

Commercial Stage	Pricing & Model	Customer Value & Expansion Mechanism
Stage 1: Low-Friction Entry Single Bay Pilot	\$295 Flat Setup Fee (Single Bay Camera)	We install a single camera in one active service bay. The low upfront cost removes purchasing friction and makes it an effortless 'yes' for independent shop owners.
Stage 2: ROI Proof Daily Telegram Scorecard	Instant Value Proof (Wrench-Time Recovery)	Owners receive automated end-of-day Telegram scorecards detailing recovered unbilled labor, idle bay minutes, and turnaround velocity. The system proves its ROI in week one.
Stage 3: SaaS Recurring Full Facility Expansion	\$99 / Month (Recurring Subscription)	Once initial value is established, we lock in the \$99/month software subscription and expand camera coverage across all remaining service bays, scaling monthly recurring revenue (MRR).

COMMERCIAL ADVANTAGE

Core Strategic Wedge: Independent auto shops operate on tight labor margins. Proving recovered wrench-time via automated daily Telegram messages transforms Inbound Surveillance from a security cost center into an indispensable profit driver.

4. Inbound Crew: Roles & Operational Responsibilities

Each team member oversees specialized operational domains while maintaining complete visibility across the full system lifecycle:

Team Member	Role & Title	Core Operational & Technical Responsibilities
Chanratharo Rath	Founder & Lead Architect	• Bridges cutting-edge edge AI architecture with bottom-line garage profitability. • Formulates system messaging focused on recovering lost revenue from unbilled wrench-time. • Directs brand identity: authored the gritty, high-contrast industrial 'terminal' UI aesthetic. • FirstWave Pitch Lead: creates live demo collateral, delivers stage presentations, and co-authors business plans.
Ly Sothun	Business Planning & Web Presence	• Manages operational business planning in close partnership with executive leadership. • Owns the Lean Canvas financial model (\$295 setup fee + \$99/month SaaS subscription). • Leads web engineering: builds and maintains the high-converting commercial landing page. • Governs milestone roadmaps, project timelines, and early customer acquisition funnels.
Eang HourMeng	Core Systems Engineer	• Co-leads end-to-end edge hardware and software system engineering. • Architects zero-cloud local edge pipeline (YOLO11 pose estimation & kinematic tracking). • Implements virtual safety/bay ROI zones and hysteresis filtering (GhostCounter). • Collaborates on integrating real-time telemetry graphics into the web operations console.
Sok Ratanak Vichea	Core Systems Engineer	• Co-leads computer vision algorithms, camera adapters (RTSP/ONVIF/Phone), and edge inference. • Engineers automated Telegram dispatch engine: real-time photo proofing and daily scorecards. • Optimizes local ONNX runtimes (YuNet + SFace) for high FPS without cloud dependency. • Ensures live production builds reflect the industrial FirstWave competition brand standards.

5. Core Engineering Engine: Autonomous Edge Intelligence

HourMeng and Vichea represent the technical engine of Inbound Crew. Their mission is building an '**invisible**' tracking system that monitors productivity, safety, and bay occupancy without interrupting mechanics while they work. By engineering the system entirely from scratch to execute locally, they eliminate expensive cloud GPU bandwidth costs and latency delays.

6. Conclusion: Built for the Garage Floor

Ultimately, the defining strength of the Inbound Crew is that we keep our technology grounded in shop-floor reality. In the fast-paced, high-pressure world of commercial auto repair, technology is only valuable if it actively protects the garage owner's revenue.

By tearing down the walls between coding and selling, we have built an agile team that is equally at home optimizing neural network runtimes as we are standing on a greasy garage floor pitching directly to an owner. We are not just developers releasing another generic software package; we are a united crew deploying invisible tools tailored specifically for trade businesses.

TEAM READINESS & VISION

Summary for FirstWave Pitch: Inbound Crew blends deep edge AI engineering with authentic trades empathy. We have the technical skill to build Inbound Surveillance from scratch, the commercial acumen to monetize it, and the relentless drive to scale.
